(1) Índice Epidémico (IE) para una enfermedad dada es la razón entre los casos presentados en el periodo correspondiente (o los casos acumulados hasta el fin de dicho periodo, si se trata del Índice Epidémico Acumulado) y los casos que se esperan o se prevén (mediana del quinquenio anterior) para el mismo periodo. Si el valor del IE se encuentra entre 0,76 y 1,24 la incidencia se considera normal; si es menor o igual a 0,75 la incidencia se considera baja; si es mayor o igual a 1,25, la incidencia se considera alta. En enfermedades de escasa incidencia este IE no es de utilidad dado que pequeñas oscilaciones en el número de casos producen grandes variaciones en el mismo.

(+) Casos sobre mediana cero.

(..) No se dispone de datos.

**Comentario general:** Durante el presente periodo las siguientes rúbricas han presentado:

a. IE >1,24: SALMONELOSIS.

b. IE < 0,76: GRIPE, VARICELA, PAROTIDITIS, LEISHMANIASIS.

- Sobre las demás EDO no se ha recibido la notificación de ningún caso.
- Durante el presente periodo 29-32 se han declarado dos Brotes Epidémicos de Covid-19, de ámbito familiar, en Calera y Chozas y Talavera de la Reina.
